Statistics: Mean 33.355; Variance 174.564; scale 0.191

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B
                                                                                                                                                                PT DNA encoding proteins which can be incorporated with wild type principles of viral replication, especially hepatitis B virus Prinhibition of viral replication, especially hepatitis B virus Ps Claim 15; Page 35; 60pp; English.

CC protein that is encoded by the full-length HBV precore gene. CC protein that is encoded by the full-length HBV precore gene. CC protein that is encoded by the full-length HBV precore gene. CC protein can be incorporated into HBV nucleocapsids along CC with the p21 core protein (see W50251), which is the usual nucleocapsid component, and thereby render the nucleocapsid component and thereby render the p22 (see W50242), p18 (see W50236). Met-p18 (see W50237) and Met-p28 (see W50242), p18 (see W50236). The inhibitory proteins can be produced by recombinant methods using claimed expression vectors and host cells. They can be provided exogenously to the target cells for use in inhibiting HBV replication. Alternatively, a nucleic acid construct that directs overexpression of an inhibitory protein in target cells is used for the gene therapy of HBV infection.
                                                                                   Query Match

                                                                                                                                                                DR N-ESDB; (29105.)

Pr Vaccine comprises recombinant, attenuated pox-virus - use for pr vaccinating against viral infections such as rabies, hepatitis B, PT HIV, HSV, EBV, CMV, mumps etc.

PS Disclosure; Fig 13; 456pp; English.

CC Comprises a portion of the hepatitis B virus (HBV) pre-S region (S12/CC comprises a portion of the hepatitis B virus (HBV) pre-S region (S12/CC core) which is precisely linked to the I3L promoter derived from CC vaccinia virus. This DNA sequence was linked to the S1 and S2 core) which is precisely linked to the I3L promoter derived from CC vaccinia virus. This DNA sequence was linked to the S1 and S2 core combinant expressing the HBV gene. Other HBV genes were also used to the construction of a NYVAC recombinant expressing the HBV gene. Other HBV genes were also used to the construction. These were HBV M protein (small pre-S antigen, cospady) and HBV L (large pre-S antigen, lpsAg). Each of these gene companies were inserted individually into three different sites of CC vaccinia virus which has been modified by deletion of six non-essential regions of the genome encoding known or potential virulence factors. The deletion loci were engineered as recipient loci for the insertion of the that any recombination that did occur would lead to disruption of the CC cascol-sea

PT nucleocapsid subunit(s) into a viral nucleocapsid - useful for
PT inhibition of viral replication, especially hepatitis B virus
PS Claim 9; Page 34-35; 60pp; English.

CC crotein that is produced by elimination of the 19-amino acid leader
CC protein that is produced by elimination of the 19-amino acid leader
CC protein that 25 kDa full-length HBV precore protein (see
CC the presence of high levels of HBV precore protein is inhibited in
CC the presence of high levels of HBV precore protein is inhibited in
CC the presence of high levels of HBV precore or precore-related
CC proteins. These proteins can be incorporated into HBV nucleocapsids
CC along with the p21 core protein (see w50251), which is the usual
CC nucleocapsid component, and thereby render the nucleocapsids
CC expression of the precore proteins, or certain variants of them,
CC leads to transdominant inhibition of HBV replication. Suitable
CC inhibitory proteins include p25 (see w50250), p22, Mat-p22 (see
CC w50242), p18 (see w50236), Met-p18 (see w50237) and Met-p18-Het
CC (see w50238). HeteroLogous peptides (see w50237) and Met-p18-Het
CC (see w50238). HeteroLogous peptides. The inhibitory
CC proteins can be produced by recombinant methods using claimed
CC expression vectors and host cells. They can be provided exogenously
CC to the target cells for use in inhibiting HBV replication.
CC alternatively, a nucleic acid construct that directs overexpression
CC therapy of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and thereby render the nucleocapsids deficient in encapsidating HBV pregenomic RNA. Thus, over-expression of the precore proteins or certain variants of them, leads to transdominant inhibition of HBV replication. Suitable inhibitory proteins include p25 (see W50250), p22 (see W50241), Met-p22 (see W50242), p18 (see W50235), Met-p18 (see W50237) and Met-p18-Het (see W50238). These proteins can be produced by recombinant methods using claimed expression vectors and host cells, and can be provided exogenously to target cells for use in inhibiting HBV replication. Alternatively, a nucleic acid construct that directs overexpression of an inhibitory protein in target cells is used for the gene therapy of HBV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding proteins which can be incorporated with wild type nucleocapsid subunit(s) into a viral nucleocapsid useful for inhibition of viral replication, especially hepatitis B virus Disclosure; Page 41-42; 60pp; English.

This is the 21 kDa (p21) protein of hepatitis B virus (HBV) the assembled into a 180 kSa subunit nucleocapsid structure that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hepatitis B virus core protein.
Hepadnavirus; HBV; woodchuck hepatitis virus; hepatitis delta virus; ground squirrel hepatitis B virus; duck hepatitis B virus;

Alteration of the C-terminus of the core protein (W09044) of hepatitis B virus (HBV) or other hepadnavirus creates a mutant polypeptide capable of reducing replication of the wild-type virus by a dominant negative mechanism. The inhibitory effect is species-specific and is achieved by deletion of a few C-terminal amino acids from the core protein, and/or by joining the core protein to a hepadnavirus surface protein (see also W09045), creating a core-surface fusion. Such mutant polypeptides (see also W09046-50) can be used to treat hepadnavirus, e.g. HBV,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WO9700698-A1.

                                                              Recombinant DNA coding for polypeptide - have specificity of hepatitis B viral antigens in detection or antibody stimulation Example; Figs 3-4; 43pp; English. Human serum from a single HBsAg positive, HBeAg positive donor (serotype adym) was used to prep. a DNA-contg, pellet which was labelled with 3H or 32P as described by P. Ont, Kaplan et al (1973). The labelled DNA was then extracted with phenol from the resulting pellet using the procedure of L. I. Lutwick and W. S. Robinson (1977). It was then cloned in plasmid pBR322 which was used to transform E. coli. Micro-organisms prepd. by the processes are deposited at the NCIB as pBR322-HBV-G-L, e.g. E. coli HB101/pBR322-PSt I dG:

Hepatitis B virus.
EP--13828-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant DNA encoding Hepatitis B virus polypeptide antigens used in detection of infection and in vaccine prodn. Disclosure; 4pp; English.

Polypeptide fragments encoded by the DNA sequence are antigenic for HBV and may be used as a vaccine or in detection. Peptides may be cultured in a suitable bacterial host such as E.coli.

Fragments of the sequence are also claimed as being antigenically
                                                                                                                                                                                                                               (BIOJ ) BIOGEN NV.

Plasmid pHBV
                                                                                                                                                                Plasmid phby DN AA carries an insert (T49598) coding for a protein (W09048) comprising a hepatitis B virus (HBV) core protein (see also W09044) fused in-frame at amino acid 179 with the HBV surface protein (see also W09045) at amino acid 8. Plasmid phBV DN BB (T49599) expresses the HBV core fused at amino acid 175 to the surface protein at amino acid 112 (W09049). phBV DN AA was at least as potent an inhibitor of HBV replication as construct pHBV DN (T49597); phBV DN BB was less inhibitory than phBV DN. Vectors expressing hepadnavirus dominant negative core mutants can be utilised in the gene therapy of viral infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           11-APR-1997 (first entry)
Plasmid pHBV DN AA encoded HBV dominant negative polypeptide.

Human serum from a single HBsAg positive, HBeAg positive donor (serotype adym) was used to prep. a DNA-contry pellet which was labelled with 3H or 32P as described by P. M. Kaplan et al (1973). The labelled DNA was then extracted with phenol from the resulting pellet using the procedure of L. I. Lutwick and W. S. Robinson (1977). It was then cloned in plasmid pBR322 which was used to transform E. coli. Micro-organisms prepd. by the processes are deposited at the NCIB as pBR322-HBV-G-L, e.g. E. coli HB101/pBR322-Pst I dG: HBV-Kpn I dC: Tetk AmpS HBV+.

15 DNA used in prevention of infections by hepatitis virus B - coding gene and at least 1 virus core antigen structural gene.

15 Disclosure; Fig 3; 13pp; Japanese.

16 Disclosure; Fig 3; 13pp; Japanese.

17 The sequence is that of hepatitis virus core antigen (HBcAg). It can be used as a vaccine for the prevention of infections by hepatitis B virus (HBV) and also in the diagnosis of early stages of HBV infection. See also P40310.

The hepatitis B core gene is recombined with PV-1 DNA
and IL-1 beta to form a plasmid (Q47738) which is then used to produce
a vaccine. NB: Sequence is difficult to read in the original
specification.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Thu Dec 16 13:11:54 1999; MasPar time 12.41 Seconds 775.040 Million cell updates/sec

Title:

Description: Perfect Score: Sequence: >US3835-10-38183 (1-240) from us3835-10-38183.pep 1796 1 MDIDPYKEFGATVELLSFLP......RRRRSQSPRRRRSQSRESQC 240

Scoring table: PAM 150 Gap 11

Searched: 122810 segs, 40068593 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir60 1:pir1 2:pir2 3:pir3 4:pir4

Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 47.190; Variance 119.785; scale 0.394

Release 3.14 John F. Collins, Biocomputing Research Unit. Copyright (c) 1993-1998 University of Edinburgh, U.K. Distribution rights by Oxford Molecular Ltd

MPsrch_pp Run on: protein - protein database search, using Smith-Waterman algorithm Thu Dec 16 13:13:23 1999; MasPar time 8.61 Seconds 788.293 Million cell updates/sec

Tabular output not generated.

Title:
Description:
Perfect Score:
Sequence:

>US3835-10-38183 (1-240) from us3835-10-38183.pep 1796 1 MDIDPYKEFGATVELLSFLP......RRRRSQSPRRRRSQSRESQC 240

Scoring table: PAM 150 Gap 11

Searched: 77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 1:swissprot

Statistics: Mean 48.420; Variance 107.281; scale 0.451

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
